# ELASTIC STRINGS & SPRINGS

Created by T. Madas

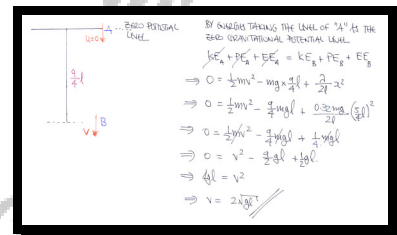

**Question 1** (\*\*)

A particle of mass  $m$  is attached to one end of a light elastic string of natural length  $l$  and modulus of elasticity  $\frac{8}{25}mg$ . The other end of the string is attached to a fixed point  $A$  on a horizontal ceiling. The particle is held level at  $A$  and released from rest.

When the particle has fallen a distance  $\frac{9}{4}l$  from  $A$ , its speed is  $v$ .

Find  $v$  in terms of  $g$  and  $l$ .

$$v = 2\sqrt{gl}$$

Handwritten solution for Question 1:

Diagram: A vertical line represents the string. Point A is at the top, and point B is at the bottom. The distance from A to B is labeled  $\frac{9}{4}l$ . A downward arrow labeled  $v$  is at point B.

BY ENERGY TAKING THE LEVEL OF "A" AS THE ZERO CONVENTIONAL POTENTIAL LEVEL

$$KE_A + PE_A + EE_A = KE_B + PE_B + EE_B$$

$$\Rightarrow 0 = \frac{1}{2}mv^2 - mg \times \frac{9}{4}l + \frac{\lambda}{2l}x^2$$

$$\Rightarrow 0 = \frac{1}{2}mv^2 - \frac{3}{4}mgl + \frac{0.32mg}{2l}(\frac{9}{4}l)^2$$

$$\Rightarrow 0 = \frac{1}{2}v^2 - \frac{3}{4}gl + \frac{1}{2}gl$$

$$\Rightarrow 4l = v^2$$

$$\Rightarrow v = 2\sqrt{gl}$$

**Question 2** (\*\*)

A particle of mass 2 kg is attached to one end of a light elastic string of natural length 0.8 m. The other end of the string is attached to a fixed point  $O$  on a rough horizontal floor. The coefficient of friction between the particle and the floor is 0.5.

When the particle is held at rest at a point  $B$  on the plane, where  $OB = 2$  m, the tension in the string is 30 N. The particle is then released from rest, from  $B$ .

Calculate the speed of the particle as the string becomes slack.

$$v \approx 2.50 \text{ ms}^{-1}$$

**FIRST AT B,  $a = 1.2$  m**

$$T = \frac{\lambda}{a} x$$

$$30 = \frac{\lambda}{0.8} \times 1.2$$

$$30 = \frac{3\lambda}{2}$$

$$\lambda = 20$$

**NEXT FRICTION WHEN IN MOTION**

Friction =  $\mu R$   
 $= \mu mg$   
 $= 0.5 \times 20$   
 $= 10$

**EQUATE BY CONSIDERING ENERGY**

Initial Energy =  $30 \times 1.2 = 36$  J

Final Energy =  $\frac{1}{2} \times 2 \times v^2 = v^2$  J

Energy lost to friction =  $10 \times 1.2 = 12$  J

$$36 - 12 = v^2$$

$$24 = v^2$$

$$v \approx 2.50 \text{ ms}^{-1}$$

**Question 3** (\*\*+)

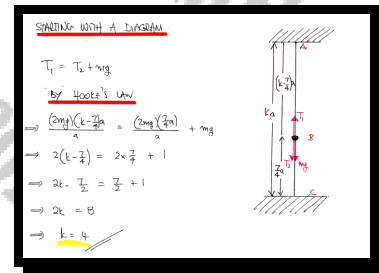

Two identical elastic strings  $AB$  and  $BC$  are fastened together at  $B$ . The natural length and modulus of elasticity of each of the strings are  $a$  and  $2mg$ , respectively.

The end  $A$  of the composite string is attached to a ceiling and the end  $C$  is attached to a floor, so that  $ABC$  lies in a vertical line where  $|AC| = ka$ .

Finally a particle of mass  $m$  is attached to  $B$  so that when the particle is in equilibrium  $|BC| = \frac{7}{4}a$ .

Determine the value of  $k$ .

,  $k = 4$

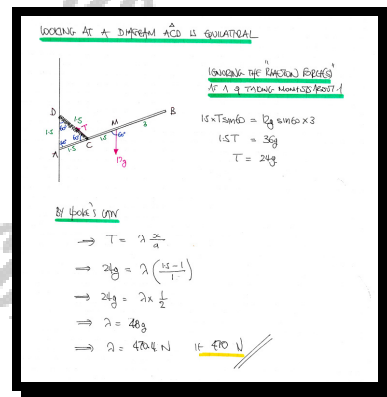

**Question 4** (\*\*+)

A uniform rod  $AB$ , of length 6 m and mass 12 kg is smoothly hinged at  $A$  on a vertical wall. An elastic string connects a point  $C$  on the rod to a point  $D$  on the wall which is 1.5 m vertically above  $A$ . The distance  $AC$  is 1.5 m.

The rod lies undisturbed in equilibrium so that  $\angle DAB = 60^\circ$ .

Given further that the natural length of the string is 1 m, determine the modulus of elasticity of the string.

$$\boxed{\quad}, \quad \boxed{\lambda = 48g \approx 470 \text{ N}}$$

### Question 5 (\*\*+)

A particle of mass  $0.5 \text{ kg}$  is attached to one end of a light elastic string of natural length  $2 \text{ m}$  and modulus of elasticity  $24.5 \text{ N}$ . The other end of the string is attached to a fixed point  $O$  on a horizontal ceiling. The particle is held level with  $O$  and released from rest. In the subsequent motion the particle reaches the lowest position at the point  $A$ , which lies vertically below  $O$ . It is assumed that there is no air resistance during the motion.

- a) Calculate the distance  $OA$ .
- b) Determine the acceleration of the particle at  $A$ .

$$\boxed{|OA| \approx 3.73 \text{ m}}, \quad \boxed{|a|_A = 32.5 \text{ ms}^{-2}}$$

(a)   $\text{Free-Body Diagram}$

$\text{By Newton's Laws}$

$$\begin{aligned} \sum F_x &= PE_x + LE_x = N \sin \theta + mg \cos \theta \\ \Rightarrow 0 &= \text{mg} \left( \frac{1}{\sqrt{2}} \right) + \frac{3}{4} \lambda^2 \\ \Rightarrow 0 &= -2 \text{mg} \left( \frac{1}{\sqrt{2}} \right) + \lambda^2 \\ \Rightarrow \lambda^2 - 2 \text{mg} \left( \frac{1}{\sqrt{2}} \right) &= 0 \\ \Rightarrow \lambda^2 - \frac{2 \text{mg}}{\sqrt{2}} \lambda - \frac{2 \text{mg}}{\sqrt{2}} \lambda &= 0 \\ \Rightarrow \lambda^2 - \frac{4}{\sqrt{2}} \lambda - \frac{4}{\sqrt{2}} \lambda &= 0 \\ \Rightarrow \lambda^2 - 2\sqrt{2} \lambda - 2\sqrt{2} \lambda &= 0 \end{aligned}$$

$\text{By Quadratic Formula}$

$$\lambda = \frac{2 \pm \sqrt{4 + 16}}{2} = \frac{2 \pm 4}{2} = 1, 3$$

$\therefore |a| = 2 + 1.7266 = 3.73 \text{ m}$

(b) IN THE LOWER POSITION

$$\begin{aligned} \sum F_x &= mg - T(a) \\ \frac{1}{2} a &= \frac{1}{2} (a) - \frac{3}{4} \lambda^2 (1.7266) \\ \frac{1}{2} a &= -\frac{3}{4} \lambda^2 \sqrt{2} \\ a &= -\frac{3}{2} \lambda^2 \sqrt{2} \\ \therefore |a| &= 31.5 \text{ m/s}^2 \end{aligned}$$

**Question 6** (\*\*+)

A particle  $P$ , of mass  $2\text{ kg}$  rests on a fixed rough plane inclined at  $\arctan \frac{4}{3}$  to the horizontal.

The coefficient of friction between the particle and the plane is  $\frac{1}{2}$ .

The point  $A$  is a fixed point at the top of the plane and lies  $D\text{ m}$  above  $P$  along a line of greatest slope.

The particle is attached to  $A$  by a light elastic string of natural length  $0.5\text{ m}$  and modulus of elasticity  $14\text{ N}$ .

Given that  $P$  is at the point of slipping down the plane determine the value of  $D$ .

$$\boxed{\phantom{0.85}}, \boxed{D = 0.85}$$

SOMEONE WITH A DIAGRAM

$\theta = \arctan \frac{4}{3}$   
 $\sin \theta = \frac{4}{5}$   
 $\cos \theta = \frac{3}{5}$

BY FORCE LAW

$$T = 1 \frac{2}{5}$$

$$T = 14 \frac{2}{0.5}$$

$$T = 28\text{ N}$$

RESOLVING THE FORCES ON THE PARTICLE

(1):  $R = 2g \cos \theta$   
 (11):  $T + \mu R = 2g \sin \theta$

COMBINING EQUATIONS

$$T + \mu R = 2g \sin \theta$$

$$28 + \frac{1}{2}(2g \cos \theta) = 2g \sin \theta$$

$$28 + \frac{1}{2}g \cos \theta = 2g \sin \theta$$

$$28 = 2g \sin \theta - \frac{1}{2}g \cos \theta$$

$$28 = \frac{1}{2}g (2 \sin \theta - \cos \theta)$$

$$28 = \frac{1}{2}(9.8)(2 \sin \theta - \cos \theta)$$

$$28 = 0.35$$

THUS THE DISTANCE D IS  $1 + 2 = 0.5 + 0.35 = 0.85\text{ m}$

**Question 7 (\*\*\*)**

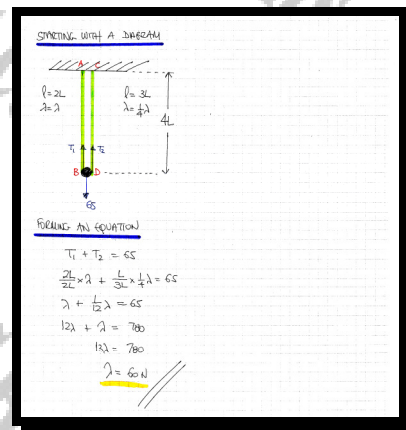

A light elastic string  $AB$  has natural length  $2L$  m and modulus of elasticity  $\lambda$  N.

A different light elastic string  $CD$  has natural length  $3L$  m and modulus of elasticity  $\frac{1}{4}\lambda$  N.

The two strings are joined together at their ends, with  $A$  joined to  $C$  and with  $B$  joined to  $D$ . The “ $A$  to  $C$ ” end is fixed to a horizontal ceiling. A particle of weight  $65$  N is attached to the “ $B$  to  $D$ ” end, and hangs in equilibrium, without touching the ground.

Given that when the particle hangs in equilibrium the length of the string  $AB$  is twice its natural length, determine the value of  $\lambda$ .

$$\lambda = 60 \text{ N}$$

**Question 8 (\*\*\*)**

A particle of mass  $0.25 \text{ kg}$  is attached to one end of a light elastic spring of natural length  $0.8 \text{ m}$  and modulus of elasticity  $6 \text{ N}$ . The other end of the string is attached to a fixed point  $O$  on a horizontal ceiling. The point  $A$  lies  $0.3 \text{ m}$  vertically below  $O$ .

The particle is held level with  $A$  and released from rest. In the subsequent motion the particle reaches the lowest position at the point  $B$ , which lies vertically below  $A$ .

It is assumed that there is no air resistance during the motion.

- Determine the initial acceleration of the particle as it is released from  $A$ .
- Calculate the distance  $AB$ .

$$|a|_A = 24.8 \text{ ms}^{-2}, \quad |AB| = \frac{124}{75} \approx 1.65 \text{ m},$$

**(a)** IN THE DIRECTION OF MOTION  
 $ma = mg + T_{spring}$   
 $\frac{1}{4}a = \frac{1}{4}g + \frac{1}{4} \cdot 2$   
 $\frac{1}{4}a = \frac{1}{4}g + \frac{1}{2}$   
 $\frac{1}{4}a = \frac{1}{4}g + \frac{15}{4}$   
 $a = g + 15$   
 $a = 24.8 \text{ ms}^{-2}$

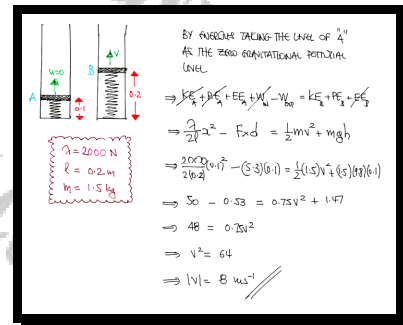

**(b)** BY REACHES THE LOWEST POSITION AS THE ZERO POTENTIAL LEVEL  
 $\cancel{K_A} + \cancel{PE_A} + \cancel{EE_A} = \cancel{K_B} + \cancel{PE_B} + \cancel{EE_B}$   
 $\rightarrow \cancel{0} + \cancel{0} + \cancel{0} = \cancel{0} + \cancel{0} + \cancel{0}$   
 $\rightarrow \cancel{\frac{1}{2}mv^2} + \cancel{\frac{1}{2}mv^2} = \cancel{\frac{1}{2}mv^2}$   
 $\rightarrow \cancel{0} + \cancel{0} = \cancel{0}$   
 $\rightarrow 20g(x+0.5) + 15 = 300x^2$   
 $\Rightarrow 192x + 98 + 15 = 300x^2$   
 $\Rightarrow 0 = 300x^2 - 192x - 113$   
 $\Rightarrow \text{QUADRATIC FORMULA OF } x = \frac{1}{2}u$   
 $\Rightarrow \text{EXACTLY SOLUTION AT POINT A}$   
 $\Rightarrow (2x+1)(300x-113) = 0$   
 $\Rightarrow x = \frac{1}{2} \leftarrow \text{A}$   
 $\Rightarrow x = \frac{113}{300} \leftarrow \text{B}$   
 $\therefore |AB| = 0.5 + x = \frac{124}{75} \approx 1.65 \text{ m}$

**Question 9** (\*\*\*)

A piston of mass  $1.5 \text{ kg}$ , enclosed in a fixed vertical tube, has one of its ends attached to a light spring of natural length  $0.2 \text{ m}$  and modulus of elasticity  $2000 \text{ N}$ . The other end of the spring is attached to the bottom of the vertical tube, so that the piston can oscillate inside the tube in a vertical direction. The motion of the piston inside the cylinder is subject to a constant resistance of  $5.3 \text{ N}$ .

The piston is pushed downwards so that the spring has length  $0.1 \text{ m}$  and released from rest. By modelling the piston as a particle determine the speed of the piston when the spring reaches its natural length.

$$\boxed{\phantom{000}}, \quad |v| = 8 \text{ ms}^{-1}$$

BY TAKING THE LEVEL OF A AS THE ZERO GRAVITATIONAL POTENTIAL LEVEL

$$\Rightarrow kx_A + p_A + E_A + W_A - W_B = kx_B + p_B + E_B$$

$$\Rightarrow \frac{1}{2}kx_A^2 - F_{rd} = \frac{1}{2}mv^2 + mgh$$

$$\Rightarrow \frac{2000}{2}(0.1)^2 - (5.3)(0.1) = \frac{1}{2}(1.5)v^2 + (1.5)(9.8)(0.1)$$

$$\Rightarrow 50 - 0.53 = 0.75v^2 + 1.47$$

$$\Rightarrow 48 = 0.75v^2$$

$$\Rightarrow v^2 = 64$$

$$\Rightarrow |v| = 8 \text{ ms}^{-1}$$

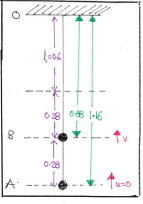

**Question 10** (\*\*\*)

A particle  $P$  of mass  $0.5 \text{ kg}$  is attached to a light spring of natural length  $0.6 \text{ m}$  and modulus of elasticity  $47 \text{ N}$ . The other end of the spring is attached to a fixed point  $O$  on a ceiling, so that  $P$  is hanging at rest vertically below  $O$ . The particle is pulled vertically downwards so that  $|OP| = 1.16 \text{ m}$  and released from rest.

Ignoring any external resistances, find the speed of  $P$  when  $|OP| = 0.88 \text{ m}$ .

$$\boxed{\phantom{000000}}, |v| = 5.6 \text{ ms}^{-1}$$

BY CHOOSING THE LEVEL OF "A" AS THE POINT OF ZERO GRAVITATIONAL POTENTIAL LEVEL

$$\Rightarrow KE + PE_s + EE_s = KE_s + PE_s + EE_s$$

$$\Rightarrow \frac{1}{2}mv^2 = \frac{1}{2}mv^2 + mgh + \frac{\lambda}{2l}x^2$$

$$\Rightarrow \frac{1}{2}mv^2 = mgh + \frac{\lambda}{2l}x^2$$

$$\Rightarrow \frac{1}{2}mv^2 = mgh + \frac{\lambda}{2l}x^2$$

$$\Rightarrow v^2 = \frac{2}{m} \left( mgh + \frac{\lambda}{2l}x^2 \right)$$

$$\Rightarrow v^2 = \frac{2}{0.5} \left( 0.5 \times 9.8 \times 0.28 + \frac{47}{2 \times 0.6} \times 0.28^2 \right)$$

$$\Rightarrow v^2 = \frac{47}{0.3} \times \left( \frac{0.28}{62.5} + \frac{0.66}{125} \right)$$

$$\Rightarrow v^2 = \frac{4606}{125} = \frac{66}{12.5}$$

$$\Rightarrow v^2 = \frac{764}{25}$$

$$\Rightarrow |v| = \frac{28}{5} = 5.6 \text{ ms}^{-1}$$

$\lambda = 47 \text{ N}$   
 $l = 0.6 \text{ m}$   
 $m = 0.5$

**Question 11 (\*\*\*)**

One end of a light elastic string, is attached to a point  $A$  on a fixed plane inclined at an angle  $\theta$  to the horizontal, where  $\tan \theta = \frac{3}{4}$ , and a particle of mass  $10 \text{ kg}$  is attached to the free end of the string.

The string has natural length  $5 \text{ m}$  and modulus of elasticity  $147 \text{ N}$ . The particle is first held at a point  $B$  on the plane, where  $B$  is below  $A$  and  $|AB| = 5 \text{ m}$ . The string is parallel to a line of greatest slope of the plane. The particle is released from rest.

- Given the plane is smooth, find the distance that the particle moves before first coming to instantaneous rest.
- Given instead that the plane is rough, and the particle first comes after a distance of  $2 \text{ m}$ , determine the coefficient of friction between the particle and the plane.

$$d = 4 \text{ m}, \quad \mu = \frac{3}{8} = 0.375$$

**a)** BY CHOOSING THE LEVEL OF  $C$  AS THE ZERO POTENTIAL LEVEL

$$KE_B + PE_B + EE_B = KE_C + PE_C + EE_C$$

$$\Rightarrow mgh = \frac{1}{2} \lambda x^2$$

$$\Rightarrow 10g(4\sin\theta) = \frac{147}{2} d^2$$

$$\Rightarrow 10g \times \frac{3}{5} d = \frac{147}{2} d^2$$

$$\Rightarrow 294d = \frac{147}{2} d^2$$

$$\Rightarrow 294 = \frac{147}{2} d$$

$$\Rightarrow d = 4 \text{ m}$$

**b)** BY CHOOSING AGAIN, WHERE  $d = 2$  AND THERE IS FRICTION (USE DIAGRAM OF PART a)

$$KE_B + PE_B + PE_F + KE_C = KE_C + PE_C + EE_C$$

$$\Rightarrow mgh - (FRICTION \times d) = \frac{1}{2} \lambda x^2$$

$$\Rightarrow 10g(4\sin\theta) - B\mu g d = \frac{147}{2} d^2$$

BUT  $d = 2$

$$\Rightarrow 10g(2 \times \frac{3}{5}) - B\mu g \times 2 = \frac{147}{2} \times 2^2$$

$$\Rightarrow 117.6 - 156.8\mu = 147$$

$$58.8 = 156.8\mu$$

$$\mu = 0.375 = \frac{3}{8}$$

**Question 12 (\*\*\*)**

A light elastic string  $AB$  has natural length  $1.25$  m and modulus of elasticity  $24.5$  N. Another light elastic string  $CD$  has natural length  $1.25$  m and modulus of elasticity  $26.95$  N.

The two strings  $AB$  and  $CD$  are joined together with  $B$  attached to  $C$  forming a longer string  $AD$  whose end  $A$  is fixed to a horizontal ceiling.

A particle of mass  $5$  kg is attached to the free end of the string at  $D$  and hangs in equilibrium, without touching the ground.

- a) Determine the length of  $AD$  in this configuration.

The strings are next joined together at their ends with  $A$  joined to  $C$  and with  $B$  joined to  $D$ . The “ $A$  to  $C$ ” end is fixed to the horizontal ceiling.

A particle of mass  $5$  kg is attached to the “ $B$  to  $D$ ” end, and hangs in equilibrium, without touching the ground.

- b) Calculate the tension in each string.

$$\boxed{\frac{10}{11}}, \quad |AD| = \frac{80}{11} \approx 7.27 \text{ m}, \quad T_{AB} = \frac{70}{3} \approx 23.3 \text{ N}, \quad T_{CD} = \frac{77}{3} \approx 25.7 \text{ N}$$

**a) WORKING AT 4. IN EQUILIBRIUM AND CONSIDERING THE TENSION**

IN AB	IN CD
$T = \frac{24.5x_1}{1.25}$	$T = \frac{26.95x_2}{1.25}$
$S_g = \frac{24.5x_1}{1.25}$	$S_g = \frac{26.95x_2}{1.25}$
$x_1 = 2.5 \text{ m}$	$x_2 = 2.5 \text{ m}$

**TOTAL LENGTH IS**  
 $1.25 + 1.25 + 2.5 + 2.5 = \frac{80}{11} \approx 7.27 \text{ m}$

**b) NEW DIAGRAM FOR THE NEW CONFIGURATION**  
**IN THE CONFIGURATION  $x_1 = x_2 = x$**

$\Rightarrow T_1 + T_2 = S_g$   
 $\Rightarrow \frac{24.5x}{1.25} + \frac{26.95x}{1.25} = S_g$   
 $\Rightarrow \frac{24.5x}{1.25} + \frac{26.95x}{1.25} = S_g$   
 $\Rightarrow \frac{51.45x}{1.25} = S_g$   
 $\Rightarrow \frac{51.45x}{1.25} = 49$   
 $\Rightarrow x = \frac{25}{21}$

**NEW THE TENSION IN EACH STRING ONLY BE FOUND**

$T_1 = \frac{24.5x_1}{1.25} = \frac{24.5 \times \frac{25}{21}}{1.25} = \frac{70}{3} \approx 23.3 \text{ N}$

$T_2 = S_g - \frac{70}{3} = \frac{77}{3} \approx 25.7 \text{ N}$

**TENSION IN AB IS  $23.3 \text{ N}$**   
**TENSION IN CD IS  $25.7 \text{ N}$**

**Question 13** (\*\*\*)

A particle  $P$  of mass  $0.5 \text{ kg}$  is attached to one end of a light elastic spring, of natural length  $1.2 \text{ m}$  and modulus of elasticity  $19.6 \text{ N}$ .

The other end of the spring is attached to a fixed point  $C$  on a horizontal ceiling.

The particle is held at the point  $B$ , where  $B$  is vertically below  $C$  and  $|BC| = 0.8 \text{ m}$ .

The spring remains straight in a vertical position.

The particle is released from rest and first comes to instantaneous rest at the point  $A$ .

Find the distance  $|AC|$ .

$$|AC| = 2.2 \text{ m}$$

Diagram: A vertical line represents the spring. Point C is at the top, point B is in the middle, and point A is at the bottom. The distance between C and B is labeled as 0.8. The distance between B and A is labeled as d. The natural length of the spring is indicated as 1.2. Arrows indicate the direction of motion: from B to A (downwards) and from A back up.

Given data:

- $\lambda = 19.6 \text{ N}$
- $m = 0.5 \text{ kg}$
- $l = 1.2 \text{ m}$

Since we have a spring, we have elastic energy at all positions except at natural length.

$$KE_B + PE_B + EE_B = KE_A + PE_A + EE_A$$

Taking the level of B as the zero gravitational potential level.

$$EE_B = PE_A + EE_A$$

$$\Rightarrow \frac{3}{2} (1.2 - 0.8)^2 = -mgd + \frac{3}{2} (d - 1.2)^2$$

$$\Rightarrow \frac{19.6}{2 \times 1.2} \times 0.4^2 = -0.5 \times 9.8 \times d + \frac{19.6}{2 \times 1.2} (d - 1.2)^2$$

$$\Rightarrow \frac{39.2}{3} = -\frac{49}{10} d + \frac{49}{6} (d^2 - 2.4d + 1.44)$$

$$\Rightarrow \frac{39.2}{3} = -\frac{49}{10} d + \frac{49}{6} d^2 - \frac{49}{6} \times 2.4d + \frac{49}{6} \times 1.44$$

$$\Rightarrow 0 = \frac{49}{6} d^2 - \frac{49}{5} d - \frac{39.2}{3}$$

$$\Rightarrow 5d^2 - 7d = 0$$

$$\Rightarrow d(5d - 7) = 0$$

$$d = \frac{7}{5} = 1.4$$

$\therefore |AC| = 0.8 + d$

$$= 0.8 + 1.4$$

$$= 2.2 \text{ m}$$

**Question 14** (\*\*\*)

A particle  $P$  of mass  $12 \text{ kg}$  is attached to the midpoint of a light elastic string of natural length  $0.5 \text{ m}$  and modulus of elasticity  $\lambda \text{ N}$ . The ends of the string are attached to two fixed points  $A$  and  $B$ , where  $|AB| = 0.8 \text{ m}$  and  $AB$  is horizontal.

When  $P$  is held at the point  $M$ , where  $M$  is the midpoint of  $AB$ , the tension in the string is  $216 \text{ N}$ .

- a) Show that  $\lambda = 360$ .

The particle is next held at the point  $C$ , where  $C$  is  $0.3 \text{ m}$  below  $M$ , and then it is released from rest.

- b) Find the initial acceleration of  $P$ .
- c) Calculate the speed of  $P$  as it passes through  $M$ .

$$|a|_{\text{initial}} = 26.2 \text{ ms}^{-2}, \quad \text{speed} \approx 1.93 \text{ ms}^{-1}$$

**(a)** By Hooke's Law  
 $T = \frac{\lambda}{x} \cdot x$   
 $216 = \frac{\lambda}{0.25} \cdot 0.25$   
 $\lambda = 360 \text{ N}$

**(b)** Looking at one half of the string  
 $T = 216 \text{ N}$   
 $2T \cos \theta = 12g$   
 $2(360 \cdot \frac{0.25}{0.25}) \cos \theta = 12g$   
 $432 \cos \theta = 117.6$   
 $\cos \theta = 0.272$   
 $\theta = 73.3^\circ$   
 $a = 26.2 \text{ ms}^{-2}$

**(c)** By conservation of energy  
 $kE_s + PE_s + EE_s = kE_s + PE_s + EE_s$   
 $\rightarrow -12g(0.3) + \left[360 \cdot \frac{0.3^2}{2 \cdot 0.25}\right] = \left[360 \cdot \frac{0.3^2}{2 \cdot 0.25}\right] + \frac{1}{2} \cdot 12 \cdot v^2$   
 $\rightarrow -360 + 90 = 6v^2 + 364$   
 $\rightarrow v^2 = \frac{39}{25}$   
 $\rightarrow v \approx 1.93 \text{ ms}^{-1}$

A particle  $P$  of mass  $m$  is attached to one end of a light elastic **spring**, of natural length  $a$  and modulus of elasticity  $8mg$ . The other end of the spring is attached to a fixed point  $A$  on a rough horizontal plane. The coefficient of friction between  $P$  and the plane is  $0.5$ .

Find the distance of  $P$  from  $B$  when  $P$  first comes to rest.

BY ORDERING POINTS ACCORDING TO THEIR POSITIONAL COORDINATE

$$|x_E + E| + |x_C - W_{C,E}| = |x_E + E| + E$$

$$\frac{2}{3}a \cdot \left(\frac{4}{3}a\right) - \frac{1}{3} \left(\frac{4}{3}a + d\right) = \frac{2}{3}a^2 \cdot d$$

$$\frac{8}{9}a^2 - \frac{4}{9}a + \frac{1}{9}d = \frac{2}{9}a^2 \cdot d$$

$$\frac{4}{9}a - \frac{4}{9}a + \frac{1}{9}d = \frac{2}{9}a^2 \cdot d$$

$$\frac{1}{9}a - \frac{1}{9}d = \frac{2}{9}a^2 \cdot d$$

$$15a^2 = 4ad = 3ad \cdot 2$$

$$0 = 3ad^2 + 4ad - 15a^2$$

$$0 = (4d + 5a) \cdot (3d - 5a)$$

$$d < \frac{1}{3}a \quad \leftarrow \text{POSS B}$$

$$d > \frac{5}{3}a \quad \leftarrow \text{POSS P}$$

∴ REQUIRED DISTANCE =  $\frac{2}{3}a + \frac{5}{3}a = \frac{7}{3}a$

$$\begin{aligned} 2 &= 6 \text{ mg} \\ 1 &= a \\ p &= \frac{1}{2} \end{aligned}$$

**Question 16** (\*\*\*)

A particle of mass 2 kg is suspended from a fixed point  $P$  by a light elastic string, and rests in equilibrium at a vertical distance  $4d$  below  $P$ .

When a different particle of mass 5 kg is suspended from the fixed point  $P$  by the same light elastic string, it rests in equilibrium at a vertical distance  $7d$  below  $P$ .

Determine the modulus of elasticity of the string.

$$\boxed{\phantom{000}}, \lambda = 19.6 \text{ N}$$

LOOKING AT THE TWO DIAGRAMS

$$\begin{aligned} \Rightarrow T_1 &= 2g & \Rightarrow T_2 &= 5g \\ \Rightarrow \frac{\lambda}{4d} &= 2g & \Rightarrow \frac{\lambda}{7d} &= 5g \\ \Rightarrow \lambda &= 8gd & \Rightarrow \lambda &= 35gd \\ \Rightarrow \lambda(4d - l) &= 2gd & \Rightarrow \lambda(7d - l) &= 5gd \end{aligned}$$

DIVIDING THE EQUATIONS WILL ELIMINATE  $\lambda$

$$\frac{\lambda(4d - l)}{\lambda(7d - l)} = \frac{2gd}{5gd} \Rightarrow \frac{4d - l}{7d - l} = \frac{2}{5}$$

$$16d - 2l = 14d - 2l \Rightarrow 2d = 7d - l \Rightarrow l = 5d$$

Putting into  $\lambda(4d - l) = 2gd$

$$\lambda = \frac{2gd}{4d - l} = \frac{2gd}{4d - 5d} = \frac{2gd}{-d} = -2g = -19.6 \text{ N}$$

## Question 17 (\*\*\*)

A particle  $P$  of mass  $m$  kg is attached to one end of a light elastic string of natural length  $0.8$  m and modulus of elasticity  $mg$  N. The other end of the string is attached to a fixed point  $O$  on a smooth plane inclined at  $\theta$  to the horizontal, where  $\tan \theta = \frac{4}{3}$ .

The particle is released from rest from  $O$  and moves down the plane without any air resistance and without reaching the bottom of the plane.

- Determine the greatest speed of  $P$  in the subsequent motion.
- Find the distance of  $P$  from  $O$ , when it reaches the lowest point on the plane.

$$|v|_{\max} = 4.19 \text{ ms}^{-1}, \quad d \approx 2.64 \text{ m}$$

**(a) MAX SPEED WILL OCCUR WHEN ACCELERATION IS ZERO, SO IN EQUILIBRIUM**

$T = mg \sin \theta$   
 $\frac{\lambda}{l} x = mg \sin \theta$   
 $\frac{mg}{0.8} x = mg \sin \theta$   
 $x = 0.64$

**• NOW RE-APPLY THE LEVEL OF O AS THE ZERO POTENTIAL LEVEL**

$\cancel{KE_0} + \cancel{PE_0} + \cancel{EE_0} = \cancel{KE_0} + PE + EE$   
 $0 = \frac{1}{2}mv^2 - mgh + \frac{\lambda}{2l}x^2$   
 $0 = \frac{1}{2}mv^2 - mg(0.8 \sin \theta) + \frac{mg}{0.8} \cdot \frac{0.64^2}{2}$   
 $v^2 = \frac{2g(0.8 \sin \theta - 0.64)}{1}$   
 $v^2 = \frac{10.976}{1}$   
 $|v|_{\max} = 4.19 \text{ ms}^{-1}$

**(b) BY RE-APPLYING AGAIN**

$\cancel{KE_0} + \cancel{PE_0} + \cancel{EE_0} = \cancel{KE_0} + PE_{\text{bottom}} + EE_{\text{bottom}}$   
 $0 = -mgh + \frac{\lambda}{2l}x^2$   
 $-mgh = -\frac{\lambda}{2l}x^2$   
 $2lH = x^2$   
 $2l(l \sin \theta) = x^2$   
 $\frac{0.8}{2} = \frac{x^2}{2}$   
 $125x^2 - 160x - 128 = 0$   
 $x = \frac{160 \pm \sqrt{83600}}{250}$   
 $x = \frac{160 \pm 289.13}{250}$   
 $x = \frac{449.13}{250} = 1.83733 \dots$

$\therefore |OP|_{\max} = 0.8 + 1.83733$   
 $|OP|_{\max} \approx 2.64 \text{ m}$

**Question 18** (\*\*\*)

A light elastic string has natural length 1 m and modulus of elasticity 10 N.

The two ends of the string are attached to two points  $A$  and  $B$ , which are 1.2 m apart on a horizontal ceiling.

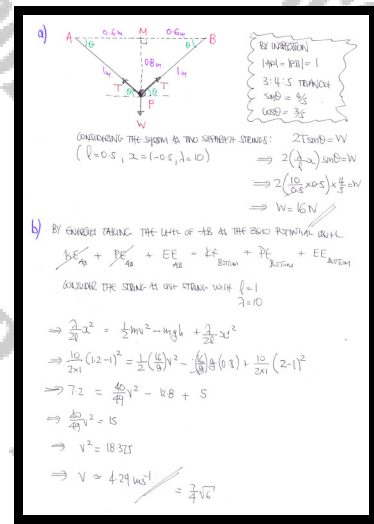

A particle  $P$  is attached to the midpoint of the string and hangs in equilibrium 0.8 m below the level of  $AB$ .

- a) Calculate the weight of  $P$ .

$P$  is then raised and released from rest from the midpoint of  $AB$ .

- b) Calculate the speed of  $P$  when it has fallen vertically by 0.8 m.

$$W = 16 \text{ N}, \quad V = \frac{7}{4}\sqrt{6} \approx 4.29 \dots \text{ ms}^{-1}$$

## Question 19 (\*\*\*)

A particle  $P$ , of mass  $m$ , is attached to one end of a light elastic string of natural length  $0.5 \text{ m}$  and modulus of elasticity  $2mg$ . The other end of the string is attached to a fixed point  $A$  on a rough horizontal surface.

$P$  is held at a point  $B$ , where  $|AB| = 0.5 \text{ m}$  and given a speed of  $1.4 \text{ ms}^{-1}$  in the direction  $AB$ .

$P$  comes at rest at the point  $C$ .

Determine whether this position of rest is instantaneous or permanent.

☐ , ☐ permanent

**• DRAWING AN ENERGY DIAGRAM**

$\Rightarrow kx_B + pE_B + E_B + V_B - V_{ref} = kx_C + pE_C + E_C$   
 $\Rightarrow \frac{1}{2}mv^2 - (kmg)d = \frac{1}{2}d^2$   
 $\Rightarrow \frac{1}{2}v^2 - \frac{1}{2}gd = \frac{1}{2}d^2$   
 $\Rightarrow \frac{1}{2}v^2 - \frac{1}{2}gd = \frac{1}{2}d^2$   
 $\Rightarrow 0.98 - 7.84d = 19.6d^2$   
 $\Rightarrow 98 - 784d = 1960d^2$   
 $\Rightarrow 1 - 8d = 20d^2$   
 $\Rightarrow 20d^2 + 8d - 1 = 0$   
 $\Rightarrow (2d + 1)(4d - 1) = 0$   
 $\Rightarrow d = \frac{1}{4} = 0.25$

**• FINISH AT POINT C,  $d = 0.1$  (ie extension)  $0.1$**

Tension =  $\frac{2}{3}x = \frac{2mg}{3} \times 0.1 = 0.4mg$   
 Friction =  $\mu mg = 0.4mg$

PERMANENT STOP

**Question 20** (\*\*\*)

A light elastic spring  $AB$ , of natural length  $2\text{ m}$ , has its end  $A$  attached to a fixed point on a horizontal ceiling and a particle, of mass  $3\text{ kg}$ , is attached to the other end of the spring,  $B$ , with the particle hanging in equilibrium.

The modulus of elasticity of the spring is  $100\text{ g N}$

The particle is then pulled vertically downwards, so that  $|AB| = 2.15\text{ m}$ , and released from rest.

Determine the length of  $AB$  when the particle first comes to instantaneous rest.

$$\boxed{\text{ANSWER}}, \quad \boxed{|AB| = 1.97\text{ m}}$$

SOLVE BY FINDING THE EQUILIBRIUM EXTENSION

$mg = \frac{\lambda}{l}e$   
 $e = \frac{3g \times 2}{100g}$   
 $e = \frac{3 \times 2}{100} = 0.06$   
ADDITIONAL EXTENSION  
 $2.15 - 2 - 0.06 = 0.09$

BY EQUATING THE LEVEL OF  $A$  AS THE ZERO POTENTIAL LEVEL

$\Rightarrow kE_e + PE_e + EE_e = kE_M + PE_M + EE_M$   
 $\Rightarrow -\frac{100}{2}(0.06 + 0.09) + \frac{3}{2}(0.06 + 0.09)^2 = -\frac{100}{2}(0.06) + \frac{3}{2}(0.06)^2$   
 $\Rightarrow -\frac{100}{2}(0.15) + \frac{3}{2}(0.15)^2 = -\frac{100}{2}(0.06) + \frac{3}{2}(0.06)^2$   
 $\Rightarrow -\frac{100}{2} \times 0.09 + \frac{3}{2} \times 0.09^2 = -\frac{100}{2} \times 0.03 + \frac{3}{2} \times 0.03^2$   
 $\Rightarrow -45 + 0.1215 = -15 + 0.0225$   
 $\Rightarrow -45 + 0.1215 + 15 - 0.0225 = 0$   
 $\Rightarrow -30 + 0.1 = 0$   
 $\Rightarrow 0.1 = 30$   
 $\Rightarrow 0.1 = 30$

$\Rightarrow 0 = 200d^2 - 820d + 847$

BY THE QUADRATIC FORMULA

$\Rightarrow d = \frac{820 \pm \sqrt{820^2 - 4 \times 200 \times 847}}{2 \times 200}$   
 $\Rightarrow d = \frac{820 \pm 360}{400}$   
 $\Rightarrow d = \frac{820 + 360}{400} = 2.15$  (RELEASE POINT)  
 $\Rightarrow d = \frac{820 - 360}{400} = 1.15$

ALTERNATIVE APPROACH

- FOCUS THE PARTICLE IS MOVING IN S.H.M ABOUT EQUILIBRIUM POSITION
- FIND AS WE KNOW A SPRING THE AMPLITUDE IS  $\frac{1}{2}(u + v)$  OR THE ZERO SPEED POINT MARKS THE MIDPOINTS OF THE OSCILLATION
- EQUILIBRIUM THEN YIELDS  
 $\text{EQUILIBRIUM } x = 2.15 - 0.06 = 2.09$   
 $2.15 - 2.06 = 0.09 \leftarrow \text{AMPLITUDE}$   
 $2.06 - 0.09 = 1.97$

**Question 21** (\*\*\*)

A light elastic string, of natural length 1.42 m, has each of its two ends attached to two fixed points,  $A$  and  $B$ , where  $AB$  is horizontal and  $|AB| = 1.68$  m.

A particle, of mass 2 kg, is attached to the midpoint of the string,  $M$ .

The particle is hanging in a equilibrium at the point  $C$ , where  $MC$  is vertical and  $|MC| = 0.35$  m.

The particle is then held at  $M$  and released from rest.

Calculate, correct to 2 decimal places, the speed of particle as it passes through  $C$ .

$$\boxed{\phantom{000}}, |v| \approx 1.98 \text{ ms}^{-1}$$

• START BY TRYING TO FIND THE MODULUS OF ELASTICITY

• BY PYTHAGORAS

$$|BC| = \sqrt{0.35^2 + 0.84^2} = 0.91$$

AND BY TRIGONOMETRY

$$\sin \theta = \frac{0.35}{0.91} = \frac{5}{13}$$

$$\cos \theta = \frac{0.84}{0.91} = \frac{12}{13}$$

• RESOLVE VERTICALLY, NOTING THAT THE EXTENSION IN EACH STRING IS  $0.31 - 0.71 = 0.2$

$$\Rightarrow 2T \cos \theta = 2g$$

$$\Rightarrow T \times \frac{12}{13} = g$$

$$\Rightarrow \frac{2}{0.71} \times \lambda \times \frac{5}{13} = g$$

$$\Rightarrow \frac{2}{0.71} \times 0.2 \times \frac{5}{13} = g$$

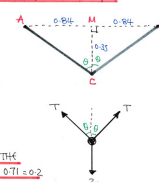

$$\Rightarrow \frac{2}{9.23} = g$$

$$\Rightarrow \lambda = 90.454$$

• USE BY CONSIDERING THE (VUL OF AB AS THE ZERO POTENTIAL LEVEL

$$\Rightarrow kE_M + PE_M + EE_M + W_M - W_{CM} = kE_C + PE_C + EE_C$$

$$\Rightarrow \frac{2}{\lambda} \lambda^2 = \frac{1}{2} m v^2 + m g |MC| + \frac{2}{\lambda} \lambda^2$$

$\Rightarrow 2 \left[ \frac{90.454}{2 \times 0.71} \right] \times \frac{1}{2} \times 2 \times 0.2^2 - 2g(0.35) + 2 \left[ \frac{90.454}{2 \times 0.71} \times (0.2)^2 \right]$

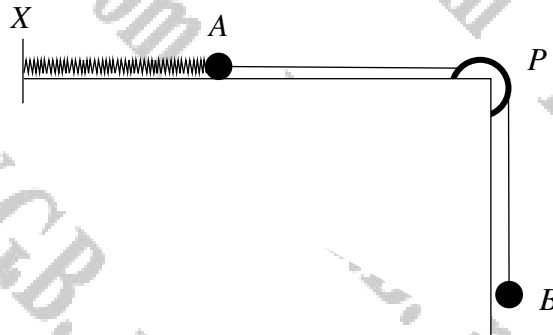

$\Rightarrow 2.15306 = v^2 - 6.86 + 5.026$

$\Rightarrow v^2 = 3.91706$

$\Rightarrow v \approx 1.9791636 \dots$

$\therefore v \approx 1.98 \text{ ms}^{-1}$

## Question 22 (\*\*\*\*)

A particle  $A$ , of mass  $m$  is at rest on a rough horizontal table.

$A$  is attached to a fixed point  $X$  on the table, by a light elastic string of natural length  $a$  and modulus of elasticity  $4mg$ .

A light inextensible string is attached to  $A$  and passes over a smooth pulley  $P$  with the other end of this string attached to another particle  $B$ , of mass  $3m$ , which hangs vertically below  $P$ .

- When  $B$  is gently released from a position such that  $|XA| = d$ ,  $A$  is about to slide towards  $P$ .
- When  $B$  is gently released from a position such that  $|XA| = \frac{5}{4}d$ ,  $A$  is about to slide towards  $X$ .

Find the value of the coefficient of friction between  $A$  and the table.

$$\mu = \frac{7}{9}$$

NEVER LET US FORGET THAT 'X' DENOTES THREE MARKS!  
MEANS THAT THERE IS A PACE TO THE RIGHT OF 'A' (OF MAGNITUDE  $3mg$  (SUPPLIED AS A TENSION))

DRAWING TWO DIAGRAMS FOR DIFFERENT 'X's

$\Rightarrow T + \mu R = 3mg$   
 $\Rightarrow \frac{2}{3}(d-a) + \mu(3mg) = 3mg$   
 $\Rightarrow \frac{2}{3}(d-a) + \mu = 3$   
 $\Rightarrow \frac{2}{3}(d-a) + \mu = 3$   
 $\Rightarrow 2d - 2a + 3\mu = 9$   
 $\Rightarrow 2d = 9 - 3\mu$

$\Rightarrow T = 3mg + \mu R$   
 $\Rightarrow \frac{2}{3}(d-a) = 3mg + \mu(3mg)$   
 $\Rightarrow \frac{2}{3}(d-a) = 3 + \mu$   
 $\Rightarrow 2d - 2a = 9 + 3\mu$   
 $\Rightarrow 2d = 9 + 3\mu$

DRAWING THE TWO EQUATIONS

$$\Rightarrow \frac{2d}{3} = \frac{9 - 3\mu}{2} + \frac{9 + 3\mu}{2}$$

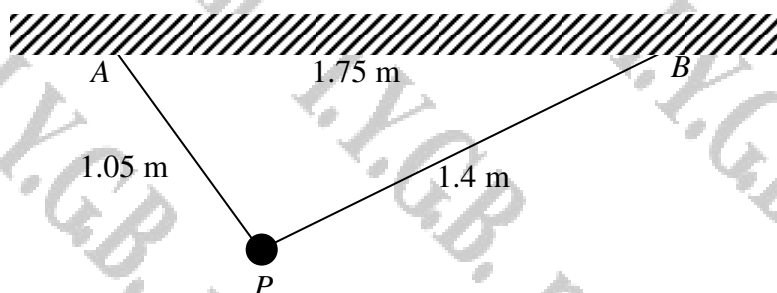

$$\Rightarrow \frac{2}{3} = \frac{18 - 3\mu + 18 + 3\mu}{2}$$

$$\Rightarrow 2 + 4\mu = 36 - 5\mu$$

$$\Rightarrow 9\mu = 34$$

$$\Rightarrow \mu = \frac{34}{9}$$

## Question 23 (\*\*\*\*)

The figure above shows a particle  $P$  of weight  $120\text{ N}$  is suspended by two light elastic strings  $AP$  and  $BP$ , where  $A$  and  $B$  are two fixed points on a horizontal ceiling, at a distance  $1.75\text{ m}$  apart.

When the system is in equilibrium,  $AP$  is stretched by  $0.3\text{ m}$  to a length of  $1.05\text{ m}$  and  $BP$  is stretched to a length of  $1.4\text{ m}$ .

- Determine the modulus of elasticity of  $AP$ .
- Given further that the energy stored in  $BP$  is  $10.8\text{ J}$  find the modulus of elasticity of  $BP$ .

$$\boxed{\phantom{000}}, \boxed{\lambda_{AP} = 240\text{ N}}, \boxed{\lambda_{BP} = 264\text{ N}}$$

a) LOOKING AT THE DIAGRAM WE OBSERVE THAT THE LENGTHS SATISFY THE PYTHAGOREAN RELATIONSHIP

$AP^2 + PB^2 = AB^2$   
 $1.05^2 + 1.4^2 = 1.75^2$   
 $1.1025 + 1.96 = 3.0625$   
 $3.0625 = 3.0625$

$\therefore \sin \theta = \frac{1.4}{1.05} = \frac{4}{3}$   
 $\cos \theta = \frac{1.05}{1.4} = \frac{3}{4}$

RESOLVING ALONG AP AS  $\angle APB = 90^\circ$

$T_1 = 120 \cos \theta$   
 $T_1 = 120 \times \frac{3}{4}$   
 $T_1 = 90\text{ N}$

By Hooke's Law on the string AP

$T_1 = \frac{\lambda}{l} \Rightarrow 90 = \frac{\lambda}{1.05} (0.3)$   
 $\Rightarrow 90 = \frac{\lambda}{3.5}$   
 $\Rightarrow \lambda = 315\text{ N}$

ALTERNATIVE BY RESOLVING VERTICALLY (HORIZONTAL)

$T_1 \sin \theta = 120$   
 $\frac{3}{4} T_1 = 120$   
 $4T_1 + 3T_2 = 600$   
 $12T_1 + 9T_2 = 1800$   
 $6T_1 + 9T_2 = 1800$   
 $2T_1 = 1800$   
 $T_1 = 90\text{ N}$

b) RESOLVING ALONG BP (OR SIMILAR RESOLVING)

$T_2 = 120 \cos \theta$   
 $T_2 = 120 \times \frac{3}{4}$   
 $T_2 = 90\text{ N}$

NOW LOOKING AT THE STRING BP

$T_2 = \frac{\lambda}{l} \Rightarrow 90 = \frac{\lambda}{1.4} (0.3)$   
 $\Rightarrow 90 = \frac{\lambda}{4.2}$   
 $\Rightarrow \lambda = 378\text{ N}$

EVERESTY THE HORIZONTAL LENGTH OF BP IS  $1.4 - 0.3 = 1.1$

$\Rightarrow T_2 = \frac{\lambda}{l} \times 1.1$   
 $\Rightarrow 90 = \frac{\lambda}{1.1} \times 1.1$   
 $\Rightarrow \lambda = 99\text{ N}$

**Question 24** (\*\*\*\*)

A bungee jumper of mass 75 kg is attached to one end of a light elastic string, of natural length 25 m, and modulus of elasticity 3675 N.

The other end of the string is securely tied to a fixed point  $P$  on a horizontal platform, which is sufficiently high enough above the ground.

The bungee jumper steps off the platform at  $P$  and when his vertical distance from  $P$  is  $x$  m his speed is  $v$  ms<sup>-1</sup>.

The bungee jumper is modelled as a particle, falling without air resistance, with Hooke's law applying whilst the string is taut.

- a) Show that for  $x \geq 25$

$$25v^2 = -49x^2 + 2940x - 30625,$$

and hence calculate, correct to 2 decimal places, the greatest value of  $x$ .

- b) Determine the greatest value of  $v$ , during his jump.

$$\boxed{x_{\max} = 30 + 5\sqrt{11} \approx 46.58 \text{ m}}, \quad \boxed{v_{\max} = 7\sqrt{11} \approx 23.22 \text{ ms}^{-1}}$$

a) BY CONSIDERING ENERGIES TAKING THE LEVEL OF "P" AS THE ZERO  
GRAVITATIONAL POTENTIAL WE OBTAIN

$\Rightarrow \cancel{PE_g} + PE_s + KE = \cancel{PE_g} + PE_s + KE$   
(IGNORES  $W_{air}$  &  $W_{loss}$  HERE)

$\Rightarrow 0 = \frac{1}{2}mv^2 - mgh + \frac{1}{2}k(x-l)^2$

$\Rightarrow 2mgh - \frac{1}{2}k(x-l)^2 = mv^2$

$\Rightarrow 1470x - \frac{1}{2}(3675)(x-25)^2 = 75v^2$

$\Rightarrow 1470x - 147(x^2 - 50x + 625) = 75v^2$

$\Rightarrow 1470x - 147x^2 + 7350x - 91875 = 75v^2$

$\Rightarrow 75v^2 = -147x^2 + 8820x - 91875$

$\Rightarrow 25v^2 = -49x^2 + 2940x - 30625$  (AS REQUIRED)

NOW MAXIMUM VALUE OF  $x$  WILL OCCUR WHEN  $v=0$

$\Rightarrow 0 = -49x^2 + 2940x - 30625$

$\Rightarrow 49x^2 - 2940x + 30625 = 0$  (49)

$\Rightarrow x^2 - 60x + 625 = 0$

$\Rightarrow (x-30)^2 - 900 + 625 = 0$

$\Rightarrow (x-30)^2 = 275$

$\Rightarrow x-30 = \pm \sqrt{275}$

$\Rightarrow x = 30 + 5\sqrt{11} \approx 46.58$   
 $x = 30 - 5\sqrt{11} \approx 13.42$  (STRIKE WITH SLASH)

b) NOW FOR MAX SPEED  $\Rightarrow$  ZERO ACCELERATION

$\Rightarrow$  EQUILIBRIUM

$\Rightarrow T = mg$

$\Rightarrow \frac{1}{2}kx = mg$

$\Rightarrow x = \frac{2mg}{k}$

$\Rightarrow x = \frac{2 \times 75 \times 9.8}{3675}$

$\Rightarrow x = 5$

$\Rightarrow x = 25 + 5 = 30$

USING THE ENERGY EQUATION WITH  $x=30$

$\Rightarrow 25v^2 = -49x^2 + 2940x - 30625$

$\Rightarrow 25v^2 = -49(30)^2 + 2940(30) - 30625$

$\Rightarrow 25v^2 = 13475$

$\Rightarrow v^2 = 539$

$\Rightarrow |v| \approx 23.22 \text{ ms}^{-1}$  (7.17)

**Question 25** (\*\*\*\*)

A light elastic string  $AB$ , of modulus of elasticity  $mg$  and natural length  $l$ , is fixed to a point  $A$  on a rough plane inclined at an angle  $\beta$  to the horizontal.

The other end of the string  $B$  is attached to a particle of mass  $m$  which is held at rest on the plane so that  $|AB| = l$ . The string lies along a line of greatest slope of the plane, with  $B$  lower than  $A$ .

The coefficient of friction between the particle and the plane is  $\mu$ ,  $\mu < \tan \beta$ .

The particle is released from rest.

- a) Show that when the particle first comes to rest it has moved down the plane by a distance

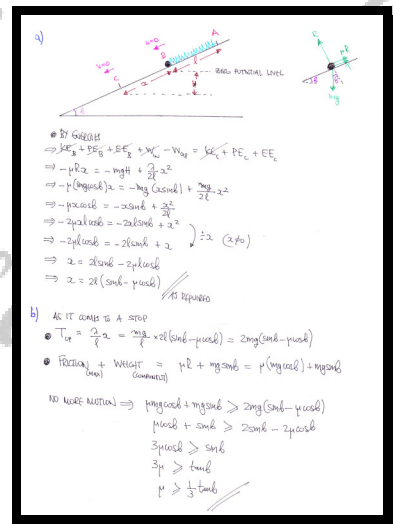

$$2l(\sin \theta - \mu \cos \beta).$$

Once the particle comes to rest there is no further motion.

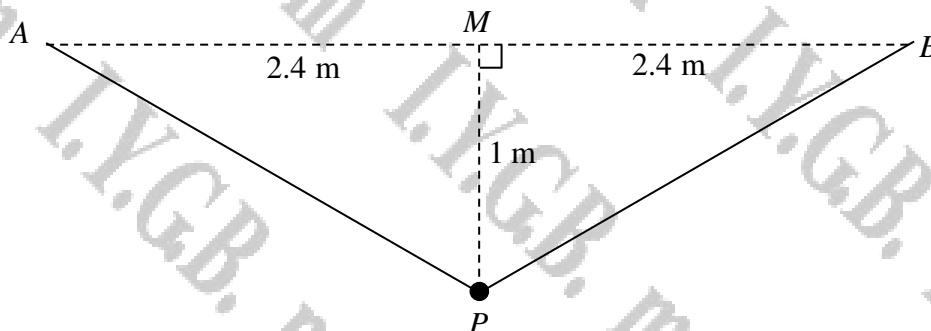

- b) Show further that

$$\mu \geq \frac{1}{3} \tan \beta$$

proof

## Question 26 (\*\*\*\*)

One of the two ends of each of two identical light strings  $AP$  and  $BP$ , are attached to a particle  $P$  of mass  $m$  kg. The other ends of each of the strings,  $A$  and  $B$ , are fixed at the same horizontal level, 4.8 m apart. The particle rests in equilibrium 1 m below  $M$ , where  $M$  is the midpoint of  $AB$ . Each of the strings has natural length 2 m and modulus of elasticity of 637 N.

- a) Show that  $m = 15$ .

The particle is then held at  $M$  and released from rest.

- b) Find the acceleration of  $P$ , when it has fallen vertically down by 0.7 m.  
c) Calculate the maximum speed of  $P$  in the subsequent motion.

$$a = 2.6656 \text{ ms}^{-2}, \quad V_{\text{max}} \approx 3.91833... \text{ ms}^{-1}$$

**a)** By Pythagoras,  $|AP| = \sqrt{2.4^2 + 1^2} = 2.6 \text{ m}$   
 Extension  $= 2.6 - 2 = 0.6 \text{ m}$   
 Tension  $= \frac{637}{2} \times \frac{0.6}{2} = 95.55 \text{ N}$   
 Resolving vertically  
 $2 \times 95.55 = mg$   
 $2 \times 95.55 \times \frac{1}{9.8} = m$   
 $m = 15$

**b)** By Pythagoras,  $|PM| = \sqrt{2.4^2 + 0.3^2} = 2.5 \text{ m}$   
 Extension  $= 2.5 - 2 = 0.5 \text{ m}$   
 Tension  $= \frac{637}{2} \times \frac{0.5}{2} = 159.25 \text{ N}$   
 Resolving vertically  
 $2 \times 159.25 - mg = ma$   
 $2 \times 159.25 - 15 \times 9.8 = 15a$   
 $a = 2.6656 \text{ ms}^{-2}$

**c)** Max speed occurs when acceleration is zero, i.e. at equilibrium.  
 By conservation of energy, the level of the particle at the zero potential level.  
 $\frac{1}{2}mv^2 = E_{\text{elastic}} + E_{\text{potential}}$   
 $\frac{1}{2} \times 15 \times v^2 = \frac{1}{2} \times \frac{637}{2} \times \frac{0.5^2}{2} + 15 \times 9.8 \times 0.7$   
 $\frac{15}{2}v^2 = 7.5 \times 0.5^2 + 102.9$   
 $v^2 = \frac{7.5 \times 0.5^2 + 102.9}{7.5}$   
 $v = 3.91833... \text{ ms}^{-1}$

## Question 27 (\*\*\*\*)

A long straight vertical wall stands on a **rough** horizontal plane. The fixed point  $O$  lies at the bottom of the wall, at some point along the edge between the wall and the plane. An elastic string has one end attached to  $O$  and the other end attached to a particle of mass  $2\text{ kg}$ . The string has natural length  $1.6\text{ m}$  and modulus of elasticity  $200\text{ N}$ . The coefficient of friction between the particle and the plane is  $\mu$ .

The particle is pulled at some point  $A$  on the plane, so that  $OA$  is perpendicular to the wall and  $|OA| = 2\text{ m}$ .

The particle is projected towards along  $AO$ , towards  $O$  with speed  $10\text{ ms}^{-1}$  and travels in a straight line hitting the wall at  $O$  with speed  $v\text{ ms}^{-1}$ .

- a) Assuming that air resistance can be ignored express  $v^2$  in terms of  $\mu$ .

The particle rebounds off the wall with half its speed and moves in a straight line towards  $A$ .

- b) Given the particle comes to rest as it reaches  $A$ , show that  $\mu = \frac{5}{14}$ .

$$v^2 = 110 - 39.2\mu$$

(a)  $u=10$   
 $\begin{matrix} A & & O \end{matrix}$   
 1 2  
 $\begin{matrix} m=2\text{kg} \\ \lambda=200 \\ l=1.6 \end{matrix}$   
 $\begin{matrix} \mu \\ \downarrow \\ mg \end{matrix}$   
 WORKING POTENTIAL ENERGY AS ALL MOTION TAKE PLACE AT THE SAME HORIZONTAL LEVEL  
 $\Rightarrow KE_A + EE_A + W_{fr} - W_{gr} = KE_O + EE_O$   
 $\Rightarrow \frac{1}{2}mv^2 + \frac{\lambda}{2l}x^2 - \mu R \times d = \frac{1}{2}mv^2$   
 $\Rightarrow \frac{1}{2} \times 2 \times 10^2 + \frac{200}{2 \times 1.6} \times (2-1.6)^2 - \mu(mg) \times 2 = \frac{1}{2} \times 2 \times v^2$   
 $\Rightarrow 100 + 10 - 39.2\mu = v^2$   
 $\Rightarrow v^2 = 110 - 39.2\mu$

(b) NOW SPEED HALVES TO  $v = \frac{1}{2}v$  — NOW MOTION BACK TO A  
 BY ENERGY AGAIN  
 $\Rightarrow KE_O + EE_O + W_{fr} - W_{gr} = KE_A + EE_A$   
 $\Rightarrow \frac{1}{2}mv^2 - \mu R \times d = \frac{1}{2}mv^2$   
 $\Rightarrow \frac{1}{2} \times 2 \times \left(\frac{1}{2}v\right)^2 - \mu(mg) \times 2 = \frac{200}{2 \times 1.6} \times 0.4^2$   
 $\Rightarrow \frac{1}{2}v^2 - 4\mu g = 10$   
 $\Rightarrow v^2 - 156.8\mu = 40$   
 $\Rightarrow (110 - 39.2\mu) - 156.8\mu = 40$   
 $\Rightarrow 70 = 196\mu$   
 $\Rightarrow \mu = \frac{5}{14}$   $\checkmark$  EQUATED

## Question 28 (\*\*\*\*+)

A light elastic string is fixed to a point  $A$  on a level horizontal ceiling.

When a particle of mass  $m$  is attached to the other end of the string  $B$  and hangs in equilibrium, the length  $AB$  is  $x$ .

When a different particle of mass  $M$ ,  $M > m$ , is attached to  $B$  and hangs in equilibrium, the length  $AB$  is  $y$ .

Find an expression for the natural length of the string, in terms of  $m$ ,  $M$ ,  $x$  and  $y$  and hence deduce that

$$Mx > my.$$

$$\boxed{\phantom{0}}, \frac{Mx - my}{M - m}$$

BY Hooke's LAW - LET THE NATURAL LENGTH BE  $l$

$$mg = \frac{\lambda}{l}(x-l) \quad \text{and} \quad Mg = \frac{\lambda}{l}(y-l)$$

$$\frac{mg}{\lambda} = \frac{x-l}{l} \quad \text{and} \quad \frac{Mg}{\lambda} = \frac{y-l}{l}$$

$$\frac{gl}{\lambda} = \frac{x-l}{m} \quad \text{and} \quad \frac{gl}{\lambda} = \frac{y-l}{M}$$

SIMILATING RESULTS

$$\Rightarrow \frac{x-l}{m} = \frac{y-l}{M}$$

$$\Rightarrow Mx - Ml = my - ml$$

$$\Rightarrow Mx - my = Ml - ml$$

$$\Rightarrow Mx - my = l(M - m)$$

$$\Rightarrow l = \frac{Mx - my}{M - m}$$

As  $l > 0$  and  $M > m$ , so that  $M - m > 0$ , IT IMPLIES THAT

$$\Rightarrow Mx - my > 0$$

$$\Rightarrow Mx > my$$

AS REQUIRED

## Question 29 (\*\*\*\*+)

An elastic string has one end attached to a fixed point  $O$  on a rough horizontal plane.

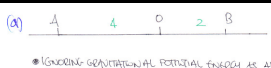

The other end of the string is attached to a particle of mass  $7 \text{ kg}$ . The string has natural length  $1.2 \text{ m}$  and modulus of elasticity  $40 \text{ N}$ . The particle is pulled at some point  $A$  on the plane so that  $|OA| = 4 \text{ m}$  and is released from rest. The particle travels in a straight line coming to rest at some point  $B$  so that  $|AB| = 6 \text{ m}$ .

- Determine the frictional force acting on the particle, assumed **constant** throughout the motion.
- Show that the particle does not remain at rest at  $B$ .

The particle next comes to rest at some point  $C$ .

- Show further that the string is not slack at  $C$ .
- Calculate the distance  $BC$ .

$$R = 20 \text{ N}, \quad |BC| = 0.4 \text{ m}$$

(a) 

• Ignoring gravitational potential energy as all motion is at the same level.

$$KE_A + EE_A + W_{\text{fr}} - W_{\text{ext}} = KE_B + EE_B$$

$$\Rightarrow \frac{1}{2} \times 7 \times 0^2 - R \times 4 = \frac{1}{2} \times 7 \times 0^2 + 0$$

$$\Rightarrow \frac{40}{2 \times 1.2} \times (4 - 1.2)^2 - R \times 4 = \frac{40}{2 \times 1.2} \times (2 - 1.2)^2$$

$$\Rightarrow \frac{370}{3} - 4R = \frac{32}{3}$$

$$\Rightarrow 120 = 4R$$

$$\Rightarrow R = 20$$

(b) At B Tension  $= \frac{40}{1.2} \times (2 - 1.2) = \frac{80}{3} = 26.66... > 20$   
 $\therefore$  Particle must move as tension is greater than  $R$

(c) By energy again and assuming at the string is slack at C.

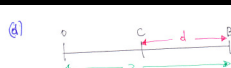

$$KE_B + EE_B + W_{\text{fr}} - W_{\text{ext}} = KE_C + EE_C$$

$$\frac{1}{2} \times 7 \times 0^2 - R \times d = 0$$

$$\frac{32}{3} = 20d$$

$$d = \frac{8}{15} \approx 0.533...$$

But this implies that  $|OC| = 2 - 0.533... = 1.466... > 1.2$   
 which implies that the string is not slack.

(a) 

• Extension at point C.

$$EE_B - W_{\text{fr}} = EE_C$$

$$\Rightarrow \frac{32}{3} - 20d = \frac{40}{2 \times 1.2} \times (2 - d - 1.2)^2$$

$$\Rightarrow \frac{32}{3} - 20d = \frac{50}{3} \times (0.8 - d)^2$$

$$\Rightarrow 32 - 60d = 50(0.64 - 1.6d + d^2)$$

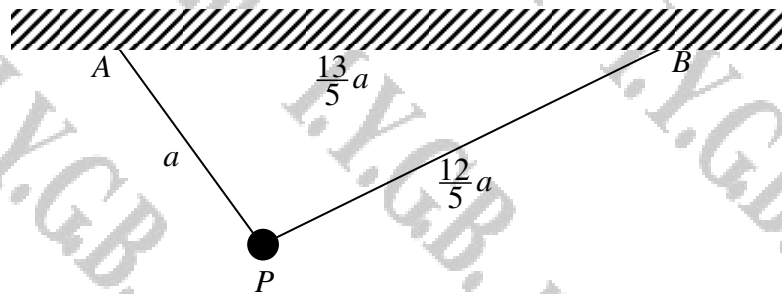

$$\Rightarrow \frac{32}{3} - 60d = \frac{50}{3} - 80d + 50d^2$$

$$\Rightarrow 0 = 50d^2 - 20d$$

$$\Rightarrow 0 = 10d(5d - 2)$$

$$\Rightarrow d = \frac{2}{5} = 0.4$$

## Question 30 (\*\*\*\*+)

The figure above shows a particle  $P$  of mass  $m$  is suspended by two light strings  $AP$  and  $BP$ , where  $A$  and  $B$  are two fixed points on a horizontal ceiling, at a distance  $\frac{13}{5}a$  apart.

The string  $AP$  is inelastic and has length  $a$ .

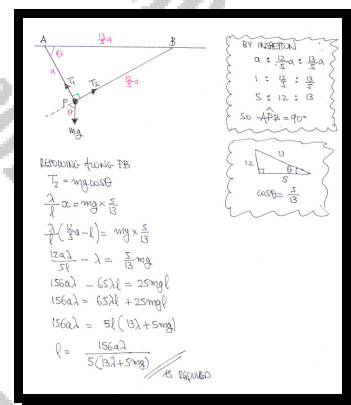

The string  $BP$  is elastic and has length  $\frac{12}{5}a$ .

The natural length of  $BP$  is  $l$  and its modulus of elasticity is  $\lambda$ .

Show clearly that

$$l = \frac{156\lambda a}{5(5mg + 13\lambda)}.$$

,  proof

## Question 31 (\*\*\*\*+)

[In this question  $g = 10 \text{ ms}^{-2}$ ]

Two particles  $A$  and  $B$ , of respective masses  $8 \text{ kg}$  and  $2 \text{ kg}$ , are attached to the ends of a light elastic string of natural length  $2.5 \text{ m}$  and modulus of elasticity  $80 \text{ N}$ .

The string passes through a small smooth hole on a rough horizontal table.

$A$  is held at a distance of  $2.5 \text{ m}$  from the hole and  $B$  is held at a distance of  $2 \text{ m}$  vertically below the hole. The coefficient of friction between  $A$  and the table is  $0.5$ .

Both particles are released simultaneously from rest.

- a) Show that both particles move towards the hole.

$A$  comes to permanent rest after moving a distance of  $0.16 \text{ m}$ .

- b) Show further that the string is slack when  $B$  comes to instantaneous rest for the first time.

proof

**Q1: PARTICLES ARE SPACED ON RELEASE**

• BY Hooke's LAW  
 $T = \frac{\lambda}{l} \cdot x = \frac{80}{2.5} \times 2 = 64 \text{ N}$

• For  $A$ :  $T = 0.5 \times 8 = 0.5 \times 8g = 4g = 40 < 64$   
 SO THERE IS A RESISTANCE TO MOVING THE BULB

• For  $B$ :  $2g = 20 < 20 = 20 < 64$   
 SO THERE IS A RESISTANCE TO MOVING THE BULB

**U INITIAL E.E. - WORK OUT = P.E. GAIN FOR B + FINAL ELASTIC ENERGY**

$$\frac{80}{2 \times 2.5} \times 2^2 - \mu R(0.16) = 2g h + \frac{80}{2 \times 2.5} (2 - 0.16 - h)^2$$

$$64 - 0.5 \times 8 \times 0.16 = 20h + 16(1.84 - h)^2$$

$$36 = 20h + 16(h^2 - 3.68h + 3.3856)$$

$$36 = 125h + h^2 - 58.88h + 54.1696$$

$$0 = h^2 - 2.88h - 0.2194$$

BY THE QUADRATIC FORMULA

$$h = \frac{2.88 \pm \sqrt{2.88^2 - 4 \times 1 \times (-0.2194)}}{2}$$

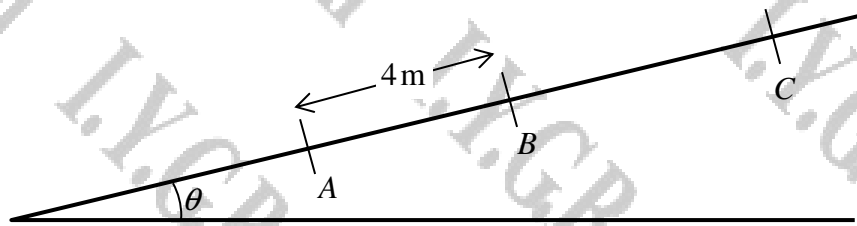

$$h = \frac{2.88 \pm \sqrt{8.2944 + 0.8776}}{2}$$

$$h = \frac{2.88 \pm \sqrt{9.172}}{2}$$

$$h = \frac{2.88 \pm 3.028}{2}$$

• STRING IS SLACK SINCE  $h = 2.954 > 1.84$

## Question 32 (\*\*\*\*+)

A light elastic string, with natural length  $1\frac{1}{2}$  m and modulus of elasticity 240 N, has one end attached to a fixed point  $B$  on a rough plane inclined at angle  $\theta$  to the horizontal, where  $\tan \theta = \frac{4}{3}$ .

A particle of mass 5 kg is attached to the other end of the string. The coefficient of friction between the particle and the plane is 0.5. The particle is held at the point  $A$  on the plane, where  $|AB| = 4$  m, and is released from rest.

The particle travels up the plane and comes to instantaneous rest at the point  $C$ , where the string is taut.

Given that  $A$ ,  $B$  and  $C$  lie on a line of greatest slope of the plane, determine the magnitude of the acceleration of the particle at  $C$ .

$$\boxed{\phantom{000}}, |\ddot{x}| = 46.28942... \text{ms}^{-2}$$

Handwritten solution for Question 32. It includes a diagram of the inclined plane with points A, B, and C. The distance AB is 4m. The string has a natural length of 1.5m and a modulus of elasticity of 240N. The particle has a mass of 5kg. The coefficient of friction is 0.5. The angle theta is such that tan theta = 4/3. The solution uses energy conservation to find the distance BC and then uses Newton's second law to find the acceleration at C.

Handwritten solution for Question 32. It includes a diagram of the inclined plane with points A, B, and C. The distance AB is 4m. The string has a natural length of 1.5m and a modulus of elasticity of 240N. The particle has a mass of 5kg. The coefficient of friction is 0.5. The angle theta is such that tan theta = 4/3. The solution uses energy conservation to find the distance BC and then uses Newton's second law to find the acceleration at C.

**Question 33** (\*\*\*\*)

Two points  $A$  and  $B$  lie at the same horizontal level so that  $|AB| = 4a$ .

A light elastic string is just taut when its ends are fixed at  $A$  and  $B$ . A heavy particle is attached to the string at the point  $P$  where  $|AP| = 3a$ .

When the particle is allowed fall, eventually resting in equilibrium at some point below  $AB$ ,  $\angle APB = 90^\circ$ .

Show that

$$4\cos^2 \theta - 12\sin^2 \theta = 3(\cos \theta - \sin \theta),$$

where  $\theta = \angle BAP$ .

 , proof

LOOKING AT A TYPICAL DIAGRAM FOR THE PROBLEM

Let  $x$  &  $y$  be the extensions in each section

RESOLVE HORIZONTALLY & VERTICALLY ON P

T cos  $\theta$  = T sin  $\theta$   
 $\therefore \frac{3a}{4a} \cos \theta = \frac{a}{4a} \sin \theta$   
 $\frac{3 \cos \theta}{4} = \frac{\sin \theta}{4}$   
 $3 \cos \theta = \sin \theta$

NOW WORKING AT THE GEOMETRY OF THE POINT BELOW TENDON AB

•  $\frac{3a+x}{4a} = \cos \theta$   
 $3a+x = 4a \cos \theta$   
 $x = 4a \cos \theta - 3a$   
 $x = a(4 \cos \theta - 3)$

•  $\frac{a+y}{4a} = \sin \theta$   
 $a+y = 4a \sin \theta$   
 $y = 4a \sin \theta - a$   
 $y = a(4 \sin \theta - 1)$

COMBINING RESULTS

$2 \cos \theta = 3 \sin \theta$   
 $a(4 \cos \theta - 3) \cos \theta = a(4 \sin \theta - 1) \sin \theta$   
 $4 \cos^2 \theta - 3 \cos \theta = 4 \sin^2 \theta - \sin \theta$   
 $4 \cos^2 \theta - 4 \sin^2 \theta = 3(\cos \theta - \sin \theta)$   
As required
